Circumference is basically the length when measured through the boundary of a circle. It is same as the perimeter of other polygons, just that it has a special name called 'circumference'. This is typically taught among basic maths calculations in schools. It is to be noted that some people falsely call circumference as circumference.

Circumference (Wikipedia) Circumference is the linear distance around the outside of a closed curve or circular object. The circumference of a circle is of special importance to geometric and trigonometric concepts. However circumference may also describe the outside of elliptical closed curves. Circumference is a special example of perimeter.

56-1 perimeter and circumference Definition Perimeter is a measure of the distance around a figure. For a polygon, the perimeter is the sum of the lengths of its sides.

*What's the difference between perimeter and circumference?*

The circumference of a circle is the distance around the outside of the circle. It is like the perimeter of other shapes like squares, but for shapes made up of straight lines, we use the word perimeter and for circles we use the word circumference. This diagram shows the circumference of a circle.

Circumference or perimeter of a circle is defined as the distance around it. The diameter of a circle is the straight line passing through the center of the circle. It is also called as the longest chord of the circle. This online diameter to circumference converter helps you to find the perimeter value from the given diameter at desired units.
