At present, the amount of copper produced by hydrometallurgy increases on the worldwide scale and represents approximately 20% [13]. Figure 1.5 shows the development of production of copper by hydrometallurgy and, for comparison, also gives the development of the total production of copper already presented in Fig. 1.2.

Hydrometallurgical Copper Extraction Process

Copper hydrometallurgy is a branch of metallurgy method to extract copper directly from those difficult-to-concentrate copper oxide ore.

Hydrometallurgy is typically divided into three general areas: (1) Leaching, (2) Solution concentration and purification, and (3) Metal recovery. Leaching In the leaching process, oxidation potential, temperature, and pH of the solution are important parameters, and are often manipulated to optimize dissolution of

years. The original impetus for solution methods for copper extraction before the development of froth flotation technology was the existence of large ore bodies of low copper content which were uneconomic to work using conventional smelting methods.

Core recently carried out an oxidative leach pilot plant to demonstrate copper recovery from a low grade chalcopyrite concentrate. The project investigated hydrometallurgical options for recovery of copper in flotation tailings, that would be sent to the tailings dam from a copper processing circuit.

obtaining of metals from their ores. Hydrometallurgy involve the use of aqueous solutions for the recovery of metals from ores, concentrates, and recycled or residual materials.

Processing techniques that complement hydrometallurgy are pyrometallurgy, vapour metallurgy, and molten salt electrometallurgy.
