The REPL provides a few helping features, specific to this interactive environment (they won't be available when executing a Julia script). One of these is the `ans` variable, automatically set up and updated by Julia. If you type `julia> 2^3`—unsurprisingly, you'll get 8. Now input `julia> ans`—you'll get 8 again! What's up with that? `ans` is a special variable that exists only in the REPL and ...
