Definitions, theorems, and postulates are the building blocks of geometry proofs. With very few exceptions, every justification in the reason column is one of these three things. The below figure shows an example of a proof. If this had been a geometry proof instead of a dog proof, the reason column would contain if-then definitions, [...]

Axioms and postulates are essentially the same thing: mathematical truths that are accepted without proof. Their role is very similar to that of undefined terms: they lay a foundation for the study of more complicated geometry. Axioms are generally statements made about real numbers. Sometimes they are called algebraic postulates.

Theorems and Proofs. In geometry, a postulate is a statement that is assumed to be true based on basic geometric principles. An example of a postulate is the statement “through any two points is exactly one line”. A long time ago, postulates were the ideas that were thought to be so obviously true they did not require a proof.

many theorems and postulates to complete their proof. In order to recall the theorems, they need to recognize which to use based on the information provided and the figure, and they must have the information stored in memory to actually retrieve it. This guide lists the theorems you will need to master in order to succeed in your Geometry class.
