Eclipse Guide on the App Store

A lunar eclipse occurs when the Moon moves into the Earth's shadow. This can occur only when the Sun, Earth, and Moon are exactly or very closely aligned (in syzygy) with Earth between the other two, and only on the night of a full moon. The type and length of a lunar eclipse depend on the Moon's proximity to either node of its orbit.

Lunar eclipse - Wikipedia

A lunar eclipse occurs when the sun, earth, and moon line up such that the shadow cast by the earth passes over the moon. Because of the distances between the sun, earth, and moon, the earth's shadow is actually made up of two parts: the penumbra which is a fainter, less focused shadow, and the umbra, which is a more focused, darker shadow.

How to See the Next Lunar Eclipse: July 16-17, 2019 ...

As the Earth's shadow (umbra) misses the Moon during a penumbral lunar eclipse, there are no other locations on Earth where the Moon appears partially or totally eclipsed during this event. A penumbral lunar eclipse can be a bit hard to see as the shadowed part is only a little bit fainter than the rest of the Moon.

Eclipses visible in Chattanooga, Tennessee, USA

For two years, a lunar eclipse will occur over the Western Hemisphere every six months. In addition to April 14, mark your calendars for this October 8 and for April 4 and September 28, 2015. If...
