Diagnosis and Management of Hepatitis C - AAFP Home

Hepatitis C is an infection caused by the hepatitis C virus (HCV) that attacks the liver and leads to inflammation. The World Health Organization (WHO) estimates that about 71 million people globally have chronic hepatitis C, with approximately 399,000 dying from this infection, primarily due to cirrhosis and hepatocellular carcinoma.

SIGN 133 • Management of hepatitis C

Hepatitis C virus (HCV) can cause both acute and chronic hepatitis. The acute process is self-limited, rarely causes hepatic failure, and usually leads to chronic infection. Chronic HCV infection often follows a progressive course over many years and can ultimately result in cirrhosis, hepatocellular carcinoma, and the need for liver transplantation.

Data about the Treatment of Hepatitis C virus (HCV) Hepatitis C virus (HCV) infection is one of the main causes of chronic liver disease worldwide.

Management of Acute HCV Infection - Hepatitis C

Hepatitis C can often be treated successfully by taking medicines for several weeks. If the infection is diagnosed in the early stages, known as acute hepatitis, treatment may not need to begin straight away. Instead, you may have another blood test after a few months to see if your body fights off the virus.

Management Of Hepatitis C Wordpress

Hepatitis A remains self-limiting during pregnancy while hepatitis E has a higher prevalence and manifests with a rigorous course in pregnant women. Screening of hepatitis C during pregnancy and its subsequent management during pregnancy are still a debatable topic. New treatments of hepatitis C and E require further evaluation for use in ...
