C programmers have been using something like object oriented programming for years. They called it good modularity. The classic example of "object-oriented C" is the standard FILE structure and its family of functions fopen, fclose, fread, fwrite, fprintf, etc. Only the "methods" of the file object, fopen etc., access the members of FILE.

Object-oriented programming is the current cure-all — although it has been around for much more than ten years. At the core, there is little more to it than finally applying the good programming principles which we have been taught for more than twenty years. Class: A class in C++ is the building block, that leads to Object-Oriented programming. It is a user-defined data type, which holds its own data members and member functions, which can be accessed and used by creating an instance of that class. A C++ class is like a blueprint for an object. A class ...
