OpenSees Parallel Parallel computation is becoming increasingly important for conducting conducting realistic earthquake simulations of structural and geotechnical systems. With the advent of multi-core processors it is rapidly becoming the only means available for users to harness the full performance of even their personal computers.

The parallel OpenSeesPy is similar to OpenSeesMP, which requires users to divide the model to distributed processors. You can still run the single-processor version as before. To run the parallel version, you have to install a MPI implementation, such as mpich. Then call your python scripts in the command line.

4 OpenSeesSP: The Single OpenSees Parallel Interpreter The simple parallel interpreter is intended for the single analysis of very large models. When running on a parallel machine, a single processor, p0, is running the main interpreter and processng commands from the main input script. The other processors are running ActorSubdomain objects [4].

OpenSeesSP is an OpenSees interpreter intended for high performance computers for performing finite element simulations of very large models on parallel machines. OpenSeesSP is easy to use even with limited knowledge about parallel computing. It only requires minimal changes to input scripts to make them consistent with the parallel process logic.
