Principles of barrier nursing in the veterinary hospital. Faye Moore. Wednesday, June 1, 2011. This article aims to remind the reader of the importance of following barrier nursing techniques when patients are in isolation. It covers not only the use of personal protective clothing and equipment to protect veterinary nurses and patients and disinfection of the unit, but also how important the psychological needs of patients are as well as effective communication between veterinarians, nurses ...

~~Principles of barrier nursing in the veterinary hospital ...~~

Barrier nursing is a largely archaic term for a set of stringent infection control techniques used in nursing. The aim of barrier nursing is to protect medical staff against infection by patients and also protect patients with highly infectious diseases from spreading their pathogens to other non-infected people. Barrier nursing was created as a means to maximize isolation care. Since it is impossible to isolate a patient from society and medical staff while still providing care, there are often

~~Barrier nursing - Wikipedia~~

•••Isolation nursing is carried out by placing the patient in a single room or side room. •••Barrier nursing- this occurs when a patient(s) is kept in a bay and extra precautions are implemented to prevent spread of the germ. It may be necessary occasionally to move a patient to another ward.

Barrier nursing entails the wearing of special protective equipment, such as an impermeable gown or a respirator, to prevent the transmission of infectious material. Contagious disease agents such as MRSA are cause for primary isolation. In other cases, known as "reverse isolation," a patient with a weakened immune system, as a result of AIDS or a bone-marrow transplant for example, is not allowed to come into contact with potentially lethal pathogens carried by visitors and nursing staff.
