Mixtures can be separated using a variety of techniques. Chromatography involves solvent separation on a solid medium. Distillation takes advantage of differences in boiling points. Evaporation removes a liquid from a solution to leave a solid material. Filtration separates solids of different sizes.

For example: rocks and sand, and a salad with lettuce, tomatoes, and croutons. Another type of mixture is called a "solution;" this is where a solid, like salt, dissolves into a liquid, like water. As you can imagine, it is easier to take apart a mixture like the rocks and sand versus the salt and water.

When we want to separate a mixture, we can use the differences in the physical properties of the components of the mixture to separate the components from each other. Hand sorting is a suitable separation method for a mixture that contains a relatively small number of large items.

## **Methods Of Physical Separation | Separating Mixtures ...**

A solution is made when a solid (which we call a solute) dissolves into a liquid (that we call the solvent) One example of a solution is salt dissolved in water. The salt and water can be separated again by evaporation (the water will evaporate if left in a hot place leaving the salt behind).

SOLUTIONS are homogeneous mixtures. A solution is a mixture of two or more substances in a single phase. At least two substances must be mixed in order to have a solution. The substance in the smallest amount and the one that dissolves or disperses is called the SOLUTE. The substance in the larger amount is called the SOLVENT.

## **What are Mixtures and Solutions? - Elmhurst University**

Distillation uses boiling to separate mixtures of liquid solutions. It takes into account that different substances in the mixture will have different boiling points. For example, if you heat salt water the water in the solution will boil before the salt.

## **Chemistry for Kids: Separating Mixtures**

Centrifugation separates heterogeneous mixtures by spinning them at very high speeds, which forces components to separate into layers. Magnetism can be used for separating magnetic materials from non-magnetic materials.

Evaporation is used for recovering dissolved substances from solutions by evaporating the solvent and crystallising the solute.

## **Separation of Mixtures | Good Science**

Like a mixture, solutions can be separated into its original components. However, unlike mixtures, solutions can be separated by evaporation. For example: the water and salt solution will evaporate as the solution is heated. The water will change from liquid to gas as the water-salt solution begins to boil, leaving only the salt behind.
