## **The Chain Of Food Biology**

The food chain is a linear sequence of organisms where nutrients and energy is transferred from one organism to the other. This occurs when one organism consumes another organism. It begins with producer organism, follows the chain and ends with decomposer organism.

organisms in a food chain by ingestion. A food chain shows what eats what in a particular habitat. It shows the flow of energy and materials from one organism to the next, beginning with a producer. The arrows between each organism in the chain always point in the direction of energy flow from the food to the feeder.

A food chain is a diagram which depicts the series of organisms which eat each other, starting with a producer (generally a plant) and ending with the apex species. It is useful to think of food chains using the rule of 10% which says that generally each successive species in a food chain receives about 10% of the energy of the preceding species.
