~~Human nervous system - The spinal cord | Britannica~~

The ventral and dorsal roots merge to form the whole spinal nerve. The spinal nerve emerges from the spinal column through an opening (intervertebral foramen) between adjacent vertebrae. This is true for all spinal nerves except for the first spinal nerve (pair), which emerges between the occipital bone and the atlas (the first vertebra).

cord that received, process and send the information to the peripheral nervous system. This system has a protective covering of bone. Peripheral nervous system - It consists of cranial nerves, spinal nerves and billions of sensory and motor neurons.

~~Neurology - Spinal Cord Introduction - YouTube~~

The nervous system is made up of vast neural networks; signalling within these circuits enables thinking, language, feeling, learning, memory, and all function and sensation. It is well-established that through plasticity of existing cells our nervous systems can adapt to situations not previously encountered, but it also has been shown that cells (NSCs) are plastic and involved in creating ...

of your peripheral nervous system.

~~Nervous system introduction—SlideShare~~

Introduction: The central nervous system is what connects the brain to the muscles of the body. When a patient has an injury to the spinal cord, movements in certain parts of the body will be affected based on the location of the injury.

~~Spinal Nerves—CliffsNotes~~

So here's the root in the back that have the ganglia and the way these spinal nerve roots work are that the afferent neurons bringing information into the central nervous system travel through the spinal nerve roots in the back and the efferent neurons that are carrying information away from the central nervous system travel in the spinal nerve roots in the front and then they come together in ...

~~Introduction to Neuroanatomy — Physiopedia~~

The nervous system is a complex network of nerves and cells that transmit signals from the brain and spinal cord to different parts of the body. Chiropractors examine the body as a whole while assessing nervous system function and potential compromises, or subluxations, in the spine.

Introduction to the Nervous System. The nervous system is the major controlling, regulatory, and communicating system in the body. It is the center of all mental activity including thought, learning, and memory. Together with the endocrine system, the nervous system is responsible for regulating and maintaining homeostasis. Through its receptors, the nervous system keeps us in touch with our ...
